

Médicos pela Vida
covid-19

Statement by MPV | Médicos pela Vida

The *Doctors for Life Movement*, following the WHO in this subject, manifests itself contrary to the experimental inoculations against CoViD-19 in children and adolescents. The purely experimental character of these inoculations can be confirmed at clinicaltrials.gov (BNT162b2 <https://clinicaltrials.gov/ct2/show/NCT04368728>).

The verdict to make mandatory this genetic experiment against minors under 18 years of age, who are considered vulnerable from an ethical and legal point of view, without adequate discretion and or capability to make conclusions that can cause harm to their future, their health, especially when it involves in-depth technical knowledge, and when the high risks of cardiac inflammation are already known, as myocarditis and pericarditis, that is, diseases that can cause permanent weakness and death thus constitutes a clear crime against humanity.

Pfizer itself recognizes in an official document that it will require at least five years to obtain satisfactory data for the definitive assessment of the risk/benefit ratio of the current inoculants available. And there are currently data that prove that the risk of myocarditis and other serious adverse events is already much higher than the risk of lethality/hospitalization by CoViD-19 in this age group (up to 18 years).

After technical clarification summed up by pediatrician Dr. Cynthia França, as well as a specialist in molecular biology and nanoparticles Dr. Giovanna Lara, on December 12, 2021, during **the 1st World Congress Doctors For Life & World Council for Health, Integral Treatment of Covid-19**, highlighted that most of the current "vaccine" proposals do not achieve the criteria that necessarily characterize it as traditional vaccines, but as immunogenic therapy, whose criteria for evaluating post-use complications should be long-term, for among other adverse events, also evaluate the risks of reactions such as teratogenicity, cancers and autoimmune diseases.

Therefore, the current inoculants available for CoViD-19 are scientific experiments performed, used/recommended without respecting the appropriate recommended scientific methodology. It is important to reinforce that all teenagers and children compound so far, a group with very low rates of severe disease and mortality due to Covid-19, not justifying mandatory vaccination.

In addition to not even being able to consider the informed consent of children or even adolescents, it is a case in which it is evident that the risks of experimental inoculations are absurdly disproportionate and immensely superior to the tiny benefits promised.

The studies examined by the FDA (US agency) show that considering the criterion of absolute risk reduction of such a scientific experiment carried out against defenseless humans, as are children, it would be necessary to inoculate 1,000,000 (one million) children to only supposedly save 01 (one) death by CoViD-19, while these same inoculations would lead to serious diseases, permanent sequelae or death, from cardiac inflammation, in a number several times greater.

Estimates of damage from inoculations, even if taken into account only one of the known serious adverse effects of experimental injections, i.e., cardiac inflammations, disregard that the numbers already recorded so far in pharmacovigilance represent only approximately 1% of the actual number of cases, according to the Harvard Pilgrim study. (<https://digital.ahrq.gov/sites/default/files/docs/publication/r18hs017045-lazarus-finalreport2011.pdf>).

Furthermore, also it highlights other adverse events related to experimental injections, such as blood clots and thrombosis, strokes, very serious neurological damage (including tetraplegia and ascending paralysis or Guillain-Barré syndrome), possible infertility, cancers, autoimmune diseases, and other serious adverse effects that seem to be discovered at every moment of this scientific experiment, which also does not bring any long-term guarantee.

In European countries, such as France, the number of children and adolescents who died from CoViD-19 after a year and a half of a pandemic was only 0.052 per 100,000 inhabitants, or 4.8 children and adolescents in 10 million people, as indicated by this scientific article, which should turn on a red light concerning the risks inherent in unselective 'vaccination'. (<https://www.aimsib.org/2021/07/25/la-comparaison-entre-mortalite-par-covid-et-letalite-due-auxvaccins-est-juste-catastrophique/>).

We also observed that especially in a clumsy way, using all kinds of constraints, children and youths have been victims of persecution and bullying by teachers and other uninformed children, so that they "vaccinate" against CoViD-19. Therefore, *Doctors for Life* ask everyone to also speak out against this threat to our children and appeal to parents to not allow their children to be exposed to these experiments whose need for a medical nature doesn't exist.

Our children and teenagers are not research animals, they are not lab rats. On the effect of pandemic waves, "vaccinating" children/teenagers against CoViD-19 would only represent a transfer of income to large pharmaceutical corporations. Nothing more than that. There is a disproportionate fear placed in society.

Additionally, children should not be used under any circumstances as a human shield. Everything is unjustifiable, especially when several studies/data from practical experience in several countries indicate that the inoculations currently available do not prevent infection, nor the transmission of the different strains of the Sars-Cov-2 virus.
